TITLE : PROJECTION OPTICAL SYSTEM AND  
PROJECTION ALIGNER USING THE  
SAME

ABSTRACT : PROBLEM TO BE SOLVED: To excellently correct the birefringence of an optical element incorporated in a projection optical system and, to transfer patterns with high accuracy, by incorporating a means which corrects the birefringence of the optical element in the optical system.

SOLUTION: A birefringence correcting member 8 is incorporated in an optical system so as to cancel phase variation. Since a material equivalent to the optical glass used for lens elements 1-5 must be used for the member 8, and birefringence having a prescribed distribution must be caused through the optical glass, such a phenomenon as the structural birefringence is utilized. Namely, the phase difference between a polarized component in the direction parallel to the grooves of a diffraction grating and the polarized component in the direction perpendicular to the groove can be set at an arbitrary value, by using a fine diffraction grating indicating the structural birefringence and appropriately selecting the duty ratio of the grating and the depths of the grooves.
